

Compression Energy Storage Project Prices

How can we model the cost of compressed air energy storage?

We can model the capex costs of Compressed Air Energy Storage from first principles in the model, by combining our models of compressor costs, storage facility costs and turbine costs. Our numbers also match top-down costs reported for past projects and technical papers into CAES.

What are the challenges of a compressed air energy storage system?

Traditional CAES systems face two big challenges: wasted heat and inconsistent power output. Willow Rock's advanced compressed air energy storage system (A-CAES) technology solves these problems: Thermal energy capture: Conventional CAES loses around 50% of energy during the air compression process.

What is compressed air energy storage (CAES)?

Compressed Air Energy Storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distribution centers. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

What is energy storage price?

The price is the expected installed capital cost of an energy storage system. Because the capital cost of these systems will vary depending on the power (kW) and energy (kWh) rating of the system, a range of system prices is provided.

Why is energy storage more expensive than alternative technologies?

High capital cost and low energy density make the unit cost of energy stored (\$/kWh) more expensive than alternative technologies. Long duration energy storage traditionally favors technologies with low self-discharge that cost less per unit of energy stored.

Will long duration energy storage be a commercial liftoff?

As outlined in the March 2023 DOE report Pathways to Commercial Liftoff: Long Duration Energy Storage, market recognition of LDES's full value, through increased compensation or other means, will enable commercial viability and market "liftoff" for many technologies even before fully achieving the Storage Shot target.
