What should NREL consider when testing energy storage systems?

Photo by Owen Roberts, NREL Considerations for energy storage system testing include the following. If cost-justified by a large purchase, consider qualification testing of battery systems. Include test conditions in specifications for battery O&M diagnostics and testing.

Why is energy availability important in assessing PV systems?

Both energy and availability are necessary metrics for assessing PV systems. If the stakeholders involved in a contract are most interested in energy production, and if the contract holds parties responsible for energy production, then it is crucial that energy losses associated with unavailability and system performance are accounted for.

How are topologies determined for PV plus storage systems?

Topologies for PV plus storage systems are typically determined by a combination of regulatory constraints and technical inputs paired with anticipated system behavior and associated system efficiency and cost.

How do control choices affect a battery charge management system?

In commercial or industrial settings, the control choices will be driven in large part by the rate structure and load profile. For example, demand charge management through a PV plus storage system dictates the strategy for when to discharge the battery and when to charge it.

Do energy storage products need periodic maintenance?

The requirements for periodic maintenance for energy storage products should be identified by the OEM (IEEE 2010). In settings where predictive analytics maintenance is economical, guidance should also be available from the manufacturer that identifies methodologies for assessing when a product may be approaching a failure mode.

Why should you track energy availability in a PV operation contract?

Tracking this availability (or unavailability) provides transparency into the equipment reliability state to all parties involved in an O&M services contract. In most PV operation contracts, energy will be the driving factor of whether the system is operating as expected.
